

Stop A Sinking Foundation

Northeast Helical, LLC.

Providing cost effective solutions to all foundation problems!

A cracked foundation can lead to serious problems. We can Help.

Northeast Helical, LLC provides solutions to solve foundation and soil problems. Utilizing helical pier technology, we handle a wide variety of geotechnical projects, including underpinning sinking foundations, installing new construction piles, providing tiebacks for retaining structures, and building supports for environmental walkways.

How Can We Help?

Our team of experienced engineers and technicians work to establish a permanent solution to every problem. Northeast Helical's expertise in geotechnical construction and remediation allows us to take on complicated projects where innovative solutions and "out of the box" thinking are required.

Areas of Expertise

New Construction

Environmental Walkways

Foundation Cracks

Existing Homes

Retaining Walls

Our Technology

Foundation Underpinning

The process begins with exposing the footing by excavating an access trench, and this can be performed either inside or outside the structure. The helical pile then screws down adjacent to the foundation, through the poor soils and into the suitable soils.

The helical pier attaches to the concrete foundation with an underpinning bracket, which can then jack the structure at the homeowner's request.

Helical Piers consist of steel shafts with circular plates that advance the pile into the ground, in a manner similar to installing a screw into wood. The circular plates are screwed through bad soils and are anchored into better load bearing soils, providing the required structural support from below.
